1. Business Context

1.1. Problem/Opportunity Statement

Problem Statement

The legacy *Food Lab* website restricts revenue growth and fractures the customer experience due to an analog checkout (cash-on-delivery only) and a post-purchase "black hole" where users have zero visibility into their order status. This leads to friction at checkout, manual delivery inefficiencies, and customer anxiety.

Opportunity Statement

By transitioning to a modern mobile app, *Food Lab* introduces seamless digital payments (**Apple Pay** and cards) and a transparent, end-to-end tracking experience—covering kitchen prep status, live courier GPS routing, and post-delivery loyalty feedback. This transformation eliminates checkout friction, drives repeat business through automated loyalty rewards, and elevates the entire operational workflow.

1.2. Project Background and Strategic Alignment

Project Background

The *Food Lab* brand operates an established food delivery service that has historically relied on a legacy web platform to manage customer orders. While the core product offering remains highly competitive, the supporting digital infrastructure has failed to evolve alongside modern consumer expectations. The legacy process contains severe functional limitations—specifically, an inflexible menu interface, an inability to process digital payments, and an absolute lack of post-purchase delivery visibility. These friction points degrade the user experience, inflate operational overhead, and cap the brand's market reach.

To bridge this operational gap, this project introduces a native mobile application designed to completely overhaul the customer journey from discovery to delivery confirmation.

Strategic Alignment

The transition from the legacy web ecosystem to the modern mobile application directly supports the organization's core strategic pillars:

Financial Growth via Frictionless Checkout: Integrating modern, one-tap payment gateways like **Apple Pay** and credit cards directly combats cart abandonment. Moving away from a strict cash-on-delivery model captures a wider, digital-first consumer demographic and drives higher average order values (AOV).

Operational Efficiency & Transparency: Introducing real-time status syncing—spanning automated kitchen acceptance, preparation countdowns, and live courier GPS tracking—eliminates the post-purchase "black hole." This significantly reduces customer anxiety and drives down operational costs associated with customer support inquiries ("Where is my food?").

Customer Retention and Brand Loyalty: By closing the delivery loop with interactive user rating states and structured loyalty loops, the application transforms a single transactional interaction into a continuous engagement cycle, maximizing customer lifetime value (CLV).

2. Business Objectives

Ref	Title	Description
BO01	Customer benefit	Customers enjoy a frictionless, premium ordering experience featuring fast Apple Pay transactions and total peace of mind via the live GPS courier tracking map.
BO02	Business benefit	The business captures higher profit margins and accelerated revenue growth by driving checkout conversions up and securing upfront digital payments.
BO03	Customer Comms	Automated push notifications elegantly bridge the communication gap by updating the user at every critical milestone, from kitchen preparation to the driver's arrival.
BO04	Reducing and eliminating of	Shifting away from cash-on-delivery completely eliminates manual cash handling risks, driver change errors,

	operational issues	and high support call volumes regarding order status.
BO05	Client recognition	The instant post-delivery rating screen allows the brand to capture immediate user validation, identify top-performing couriers, and build public brand equity.

3. Critical Success Factors/Success Factors

Ref	Title	Description and how success could be measured
CSF01	Project Deadline	20.10.2026
CSF02	Payment Gateway Reliability	Seamless end-to-end integration with payment APIs must achieve a 99.9% uptime rate to ensure Apple Pay and credit card transactions process without friction.
CSF03	Real-Time Data Syncing	The system architecture must maintain sub-second latency when syncing GPS coordinates between the courier app and the customer's live tracking interface.

4. Key Assumptions

Ref	Title	Description
KA01	Technical Delivery	There is an assumption that the technical aspects will be delivered within the project timeline.
KA02	Funding	There is an assumption that funding will be available for the project.
KA03	Resource	There is an assumption that resource will be available for the delivery of the change from all delivery areas.
KA04	Customer Information	There is an assumption that customer information and address data from the legacy platform can be securely

		migrated to the app database without any loss of integrity.
KA05	Legal and Compliance Impact	There is an assumption that the digital payment processing and live GPS location tracking will fully comply with PCI-DSS data security standards and local privacy regulations.

5. Drivers and Constraints

Driver	Description of importance of any constraints that are relevant	Priority
Time	There is an agreement that a phased implementation across August, September, and October is preferable, culminating in the final 20.10.2026 deadline.	(1)
Cost/Budget	There is an agreement that a total estimated cost of £120,000 must not be exceeded for the design, development, and deployment phases of the application.	(2)
Quality	There is an expectation that the change will be implemented successfully and to a higher standard.	(3)
Scope	There is a requirement that the minimum viable proposition/critical path and functionalities identified as part of the initial project analysis (i.e. options paper) should be delivered by August.	(4)

6. High-Level Requirements

6.1 High Level Functional Requirements

Ref	Title	Description	Priority (MoSCoW)	Related Requirements	Candidate for IT Solution
FR01	User Onboarding	The system must allow users to launch the	Must Have		A.M

	& Authentication	application, initiate a session via a "Get Started" landing page, and create or securely log into an account profile.			
FR02	Interactive Menu Discovery & Search	The system must provide a searchable, categorized product catalog (e.g., Burgers, Sandwiches, Sweets) displaying pricing, descriptions, and dynamic visual banners for promotional offers.	Must Have		A.M.
FR03	Dynamic Product Customization & Add-ons	The system must enable users to add, remove, or modify product ingredients/add-ons (e.g., extra bacon, tomato) via responsive + and - controls on the item detail screen before adding to the cart.	Must Have		D.C
FR04	Cart & Clear Order Summary	The system must calculate a real-time running subtotal, itemized delivery fees, tax totals, and permit granular quantity alterations directly within the cart overview before proceeding.	Must Have		TBC
FR05	Multi-Channel Digital	The system must integrate secure, friction-free payment choices—	Must Have		TBC

	Check out Integration	specifically Apple Pay and credit/debit card processing engines—alongside a legacy cash alternative.			
FR06	Automated Address Verification & Maps	The system must utilize GPS location-tagging to autofill customer delivery addresses and display a visual map pin confirmation on the order summary screen.	Must Have		B.O.
FR07	Real-Time Order Lifecycle Milestones	The system must track and visually display order manufacturing updates (e.g., "Preparing your order" state with active cooking progress indicators).	Must Have		TBC
FR08	Live Courier GPS Tracking Map	The system must transmit continuous geographical coordinate data from the courier's device to provide a live-updating driver progress route overlay on the user's interface.	Must Have		I.P.
FR09	Post-Delivery Feedback Loop & Ratings	The system must trigger an interactive satisfaction screen (e.g., a five-tier rating matrix) immediately following delivery confirmation to capture user validation.	Should Have		TBC

FR10	Automated Loyalty Points Allocation	The system must calculate and assign reward units to the customer's user profile upon successful delivery completion to incentivize repeat order retention.	Should Have		TBC
------	-------------------------------------	---	-------------	--	-----

6.2 High Level Non-Functional Requirements

Ref	Title	Description	Priority (MoSCoW)	Related Requirements	Candidate for IT Solution
NFR01	Security & Payment Compliance	The application must securely encrypt all data in transit using TLS 1.3, store zero raw cardholder data locally on the device, and maintain strict PCI-DSS Level 1 compliance for processing mobile transactions.	Must Have		TBC

6.3. High Level Data Requirements

Ref	Title	Description	Priority (MoSCoW)	Related Requirements	Candidate for IT Solution
DR01	Transactional Order & State Logs	The system must maintain an immutable data ledger for every purchase, capturing specific line item add-ons, localized itemization totals (\$43.40), the digital payment authorization token, and real-time delivery tracking timestamp logs.	Must Have		TBC
DR02	Customer Account & Profile	The system must persist structured data records for each user profile, containing unique identifiers, verified contact numbers, tokenized delivery coordinates, and	Must Have		TBC

		historical voucher logs.
